

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a tool constructed out of top quality materials intended to endure the most difficult operations and work environments. This particular piece of equipment can enable drivers to be able to control the blades hydraulically without leaving the seat. Side shifting units have the added ability to be able to laterally position the arms or the entire load in order to facilitate more precise carrying and position in a faster and much more efficient way.

The blade pocket is quite unique and enables the individual operating it to safely swing the blades into position without any fear of destroying the positioning cylinders. This can allow the operator the alternative to perform independent or simultaneous fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into blade positioners on available units.
